

Condition 75	APCD Equipment Requirements
<p>Prior to initiating grading activities, the proponent's contractor or engineer shall:</p> <ol style="list-style-type: none"> Include the following specifications on all project plans: One catalyzed diesel particulate filter (CDPF) shall be used on the piece of equipment estimated to generate the greatest emissions. If a CDPF is unsuitable for the potential equipment to be controlled, five diesel oxidation catalysts (DOC) shall be used. Identify equipment to be operated during construction as early as possible in order to place the order for the appropriate filter and avoid any project delays. This is necessary so that contractors bidding on the project can include the purchase, proper installation, and maintenance costs in their bids. Contact the SLOAPCD Compliance Division to initiate implementation of this mitigation measure at least two months prior to start of construction. 	
<p>Evidence of compliance: Please refer to the attached email from Kate Ballantyne that documents a conversation with Meghan Field at APCD. The requirement for one piece of equipment to be outfitted with a CDPF is not necessary since the contractor's equipment will be tier 3 or better.</p>	

Condition Satisfied

 Director, SLO County Planning

I just talked to Megan at APCD and we remembered that we removed the requirement for one piece of equipment to have a catalyzed diesel particulate filter because it is an obsolete requirement. As long as equipment is minimum tier 3, which is a requirement on our project, a CDPF is unnecessary. Therefore, we can remove condition 75 from the contract specs.
